

We now have

# 3D Imaging

## The new generation of patient care

### Special points:

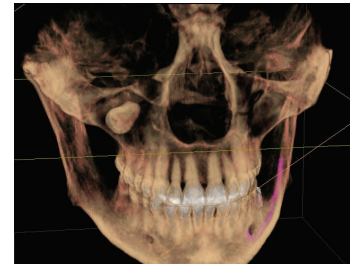

- Most accurate treatment planning
- Low radiation dose
- Fast and easy
- Done here during normal appointment time
- Comprehensive dental evaluation finds 25% more abnormalities than traditional 2D
- Lower cost than medical CT
- Easy to understand

This 3D imaging scanner has been designed for dentistry. The precise imaging permits me to diagnose from accurate, undistorted, one-to-one images. This results in greater diagnostic accuracy and greater diagnostic confidence. However, it means even more than that. 3D offers the ability to enhance treatment planning, and obtain more consistent patient outcomes. Beyond the clinical aspects, Galileos is also a wonderful patient education tool. For the first time patients can see their anatomy in accurate real-life perspectives that allows them to understand their own oral health. This improved comprehension leads to a greater bond between patient and doctor. Patient positioning is quick, just relax, and 14 seconds later the scan is complete.

Imaging software does the rest. Yes, any view we need, on demand, from the same single scan. The system also includes treatment planning software, integrated implant planning, and the ability to order surgical guides. This means that there will be no surprises when we proceed with your treatment. We chose the Galileos 3D product because of the very low radiation exposure compared to other brands of dental 3D and up to 100 times less than traditional CT scans taken at hospitals. The 3D scan with Galileos is less than half the radiation from a traditional dental film full mouth series.

3D patient scan with bone and soft tissue

We are proud to provide our patients with the very latest technology with convenience, safety and best care in mind.

3D imaging enhances the doctors ability to diagnose, treatment plan and create the most predictable outcome.

## Truly see your dental needs for the first time
